Session operator

This repo holds several sub-projects, each with its own system-prompt - there is no default one. A session that was started without a launcher script (e.g. a cloud session) is set up by the "operator":
the SessionStart hook in `.claude/settings.json` runs `claude/operator/operator.sh hook`, whose output (starting with "# Session operator") reports the environment, and says how to choose and load an option.

If that output is not in your context (the hook did not run, or failed): run `claude/operator/operator.sh hook <<< '{}'` yourself before anything else, and follow its output.
