Oracc ATF Primer

▼ Contents

Example 1 1
Example 2 3
Example 3 4

A very quick start to get you up and running with your first ATF texts by giving some annotated examples.

Example 1

Let's start with an example:

```
&P348865 = SpTU 5, 283
#project: cams
#atf: lang akk-x-ltebab
#atf: use unicode

@tablet

@obverse
1.       ṭup-pi! E₂ ep-šu₂ sip-pu rak-su E₂ rug-gu-bu
2.       {giš}IG SAG.KUL kun-nu KI{+ti₃} {id₂}har ša₂ {d}NA₃
$ single ruling
3.       40?# ina 1 KUŠ₃ US₂ AN.TA {tu₁₅}SI.SA₂ DA E₂ ša₂
```

The various ATF features illustrated here are:

The `&-line`
: Every text begins with an `&-line` giving the ID and the text's designation according to the CDLI catalog; if your text is not yet in the catalog, e-mail cdli@cdli.ucla.edu or osc@oracc.org to get the ID and designation.

`#project: cams`
: It is mandatory that you specify the project that the text belongs to. The ATF file is not valid if this line is omitted, as the #project line sends essential information to the server and is used for validation and lemmatisation. In addition, this line must come before the #atf protocol lines.

`#atf: lang akk-x-stdbab`
: You need to specify the main language and dialect for the text; for Sumerian just write `#atf: lang sux`.

`#atf: use unicode`
: You can specify that the transliteration is in Unicode (with š, ṣ, ṭ, etc and subscript numerals); if you omit this line then the transliteration must be in ASCII (with sz, s,, and t, and full-size numerals). We strongly recommend that all new ATF files use Unicode for Oracc. CDLI ATF continues to use ASCII.

`@tablet`
: You can specify an object type; this is normally @tablet, but others include @bulla and @envelope.

`@obverse, @reverse`
: You can specify the part of the object you are transliterating; the edges are given using: `@left @right @top @bottom`.

Lines of text
: Lines of text are for the most part just like regular Assyriological practice. See Example 2 for how to do breakage.

Logograms
: Logograms can be simply entered as uppercase as is natural in transliterations of Akkadian.

Determinatives, phonetic complements and glosses
:

Determinatives are given in curly brackets.

Phonetic complements and glosses are marked with a `+` immediately after the first curly bracket; they are assumed to be in the same language as the rest of the word.

Rulings
: Lines ruled on the tablet as paragraph separators, etc., can be marked with $-lines ("dollar-lines").

Numbers
: Sexagesimal (base 60) numbers that just use the DIŠ and U signs are transliterated as regular numerals. Numbers in other metrological systems are explicitly qualified as in `1(disz)`. See the numbers page and the mathematics page for more information (or the numbers and metrology in CDLI page as appropriate).

You can see here [http://oracc.museum.upenn.edu/cams/gkab/P348865] how the entire text appears online in CAMS.

Example 2

```
&P348658 = SpTU 2, 055
#project: cams
#atf: lang akk-x-ltebab
#atf: use unicode

@tablet

@obverse
1.       ṭup-pi A.ŠA₃ ki-šub-ba#-[a ...]
2.       {id₂}har-ri ša₂ {d}MUATI? x [...]
3.       ša₂ qe₂-reb UNUG#[{ki}]
```

Damage and breakage
:

There are no half-brackets in ATF: signs which are damaged are flagged with the hash-sign (`#`) after the grapheme.

Signs which are completely broken away are placed in square brackets; square brackets may not occur inside a grapheme, only before or after it. The ellipsis (`...`) may be used to indicate that an undeterminable number of signs is missing.

Signs which cannot be identified are transliterated as `x`; when a number is missing the convention is to use `n` as in `n(disz)`.

Querying, Correction and Collation
: The other flags are the query (`?`) which can be placed after a grapheme to indicate uncertainty of reading; the asterisk (`*`) which indicates a collated reading; and the exclamation mark which

indicates correction. After a corrected sign, the actual sign on the tablet may optionally be given: `a!` or `ki!(DI)`.

You can see here [http://oracc.museum.upenn.edu/cams/gkab/P348658] how the entire text appears online in CAMS.

Example 3

This shows a Sumerian text with non-sexagesimal numbers, transliterated in ASCII.

```
&P100099 = AAS 113
#atf: lang sux
@tablet
@obverse
1. 1(ban2) kasz 1(ban2) [...]
2. 1(disz) sila3 [...]
3. 1(u)? [...] gesz
4. 1(barig) kasz#? [...] x [...]
5. 3(ban2) [x]
6. nam-ha-ni sagi
7. {d}gu-la
8. mu-da-gen-na-a
9. iti sze-kar-ra-gal2-la
```
